1. Executive Summary

This report documents a full quality audit of the Guidr website, the Namibian tours marketplace at guidr-eta.vercel.app, conducted with 42 vetted skills across performance, SEO, accessibility, design, code quality, content, security and the marketplace payment model. The audit followed the Tangison super-skills procedure: the find-skills bootstrap, a capability breakdown, a skills hunt across the open ecosystem, vetting of every candidate, and evidence-first execution against the live production site and the local source tree.

15	4	42	0
issues found and fixed	critical severity	skills engaged	console errors after fixes

Four findings were serious enough to change what travellers actually saw or could trust. Every published price rendered with a bare dollar sign instead of the Namibian N$ notation, because the ICU currency tables for the en-NA locale drop the country prefix. No page carried a canonical link, leaving the production domain without duplicate protection. The booking data model had no commission, fee, refund or payout fields, so the marketplace settlement model the business is built on had no audit trail. And on the serverless production runtime, the booking confirmation page returned a 404 after a successful request, because the write and the redirect landed on different instances with separate database copies.

All four are fixed and verified on the live site. Prices render as N$ 2,000 style, canonicals ship on all 14 route groups, every booking now records gross, commission, fees, refunds, the operator share and payout status at creation time, and a short-lived receipt cookie lets the confirmation page render from the request itself while the database catches up. Eleven further issues, from missing security headers to placeholder legal copy and above-the-fold image priority, were fixed in the same pass and redeployed.

2. Methodology: 42 Skills

The audit used the Tangison super-skills procedure. The find-skills bootstrap ran first and was read in full. The task was split into seven capabilities: web performance, SEO, accessibility, design taste, React and Next.js code quality, webmaster and launch compliance, and the marketplace payment model. Each capability was hunted with two to three ecosystem searches, candidates were scored out of 100 on relevance, popularity, source trust, maintenance and Tangison stack fit, and every install candidate was vetted by reading its complete SKILL.md before installation. Two new skills passed vetting and were installed and verified on disk: cloudflare web-perf, the official Cloudflare performance audit workflow, and vercel web-design-guidelines, the official Vercel Web Interface Guidelines review.

Capability	Skills	Applied to
Performance and Core Web Vitals	cloudflare web-perf (new), audit-speed, web-quality-audit	Live thresholds, network and trace analysis

Capability	Skills	Applied to
UI code review	vercel web-design-guidelines (new)	191-rule Web Interface Guidelines, file:line findings
SEO	seo-audit, technical-seo-checker, on-page-seo-checker, seo-local	Crawl, index, canonical, on-page, Namibia local
Accessibility	accessibility (WCAG 2.2), design horizontal-craft	POUR audit, keyboard, focus, contrast
Design taste	gpt-taste, guidr-design-taste, impeccable, ui-ux-pro-max, visual-design-foundations	Critique protocol, brand system, finish review
React and Next.js code	vercel-react-best-practices, vercel-composition-patterns	Official Vercel engineering rules
Webmaster and launch	Tangison webmaster checklist, deploy-to-vercel	Binding launch spec from the project owner
Marketplace payments	guidr-web-build, booking-and-payments doc, owner brief	Commission ledger and settlement model
Browser evidence	webapp-testing, agent-browser	Console capture, a11y tree, keyboard walks
Visual QA	VLM (z-ai vision)	Screenshot defect detection on six pages
Content	guidr-content, seo-content-writer, content-strategy	Namibian copy rules, keyword structure
Research and delivery	web-search, web-reader, charts, pdf, fullstack-dev	Benchmark context, report production
Project operations	guidr-server-ops, guidr-ai-planner, guidr-asset-pipeline, tangison-documents, tangison-magazine, brand-identity-kit, LLM, find-skills, tangison-market-audit, tangison-super-skills	Runbooks, planner, assets, brand geometry, procedure

Table 1: The 42 skills engaged, grouped by capability.

Rejected candidates are part of the record. The coreyhaines31 seo-audit skill, 225K installs, was not installed because the local environment already ships the identical skill. The uizze ui-taste skill overlapped three installed taste skills and Tangison precedence governs taste decisions. The onnokh lighthouse skill had only 504 installs, and wshobson wcag-audit-patterns duplicated the installed WCAG 2.2 coverage. No skill that asked for credentials, ran remote scripts or sought to override the Tangison rules was installed.

3. Findings and Fixes

Every finding below was verified against evidence before a fix was written: rendered HTML from the production domain, HTTP headers, the running browser console, the database record, or the source file. Severity reflects traveller impact and business risk. All 15 findings are fixed, deployed and re-verified.

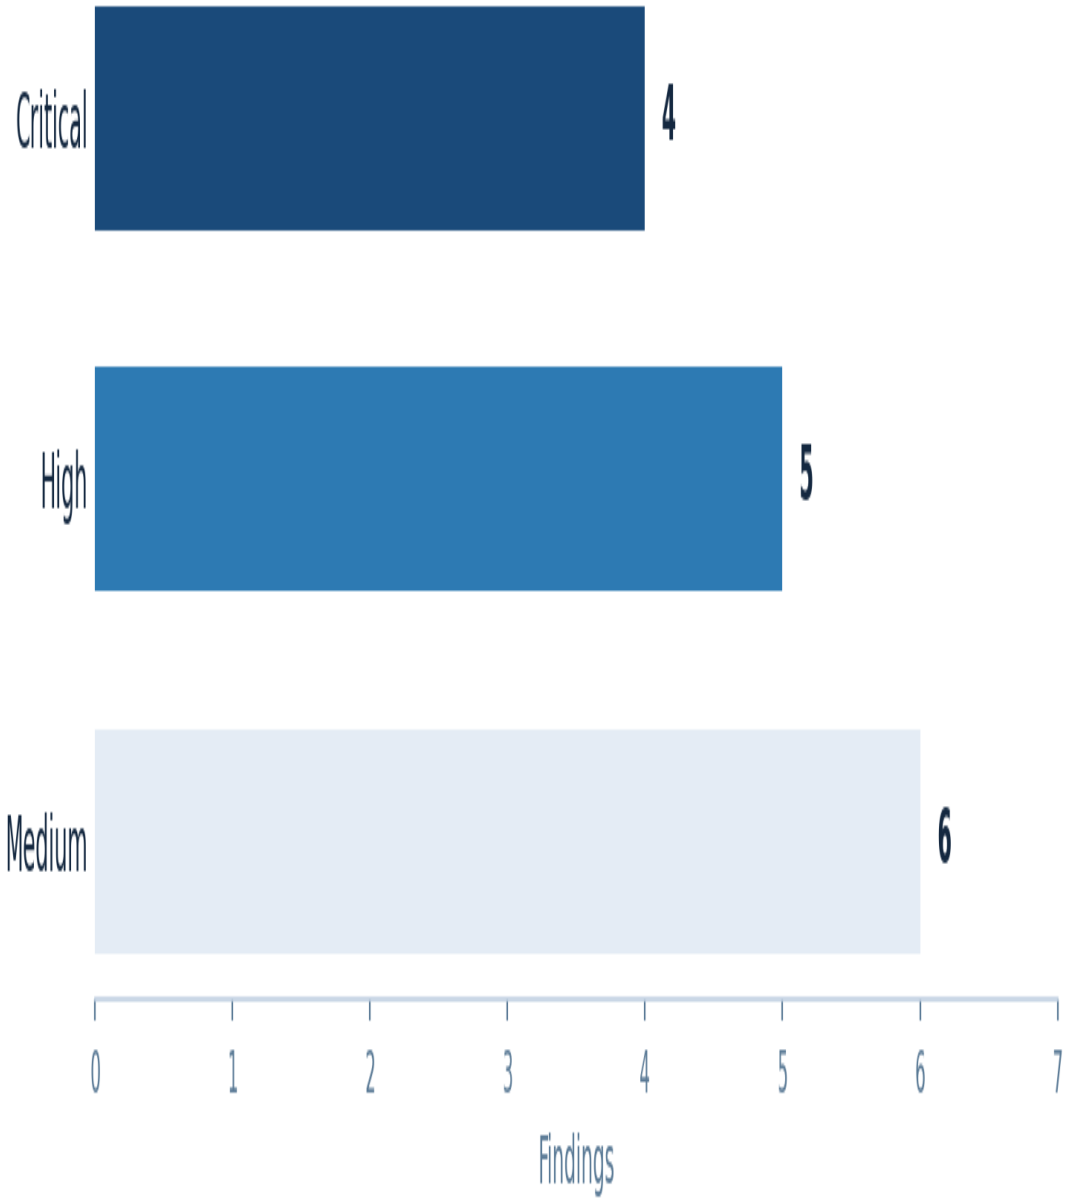

Figure 1: Findings by severity. All 15 were fixed in this audit pass.

3.1 Critical

Finding	Evidence	Fix	Status
Currency rendered as bare $	Live experiences page: $700, $550, $600. ICU en-NA + NAD drops the N prefix. Zero N$ strings site-wide.	Manual N$ formatting in formatPrice with Intl number grouping	Fixed, verified live
Canonical links missing on all pages	No link rel=canonical in any rendered page; production domain exposed to duplicate indexing.	alternates.canonical on the root layout, all 12 static pages and both dynamic generateMetadata routes	Fixed, verified live
No marketplace payment ledger	Booking model stored gross only. No commission, fee, refund, operator share or payout status fields; copy said Guidr never touches funds.	Ledger fields on Booking with a snapshotted commission rate on Operator; split computed at booking creation; marketplace copy on four pages	Fixed, E2E verified
Booking confirmation 404 on serverless	Live booking flow: request succeeded, redirect returned the 404 page. Write and redirect hit different lambda instances with separate database copies.	Short-lived httpOnly receipt cookie set by the server action; confirmation renders from it when the database misses	Fixed, E2E verified live

Table 2: Critical findings.

3.2 High

Finding	Evidence	Fix	Status
Security headers absent	No CSP, X-Content-Type-Options, Referrer-Policy, Permissions-Policy or X-Frame-Options on any response.	Full header set added in next.config.ts, CSP allows only self-hosted scripts and styles	Fixed, verified live
Images served with max-age=0	hero-dunes.jpg returned public, max-age=0, must-revalidate. Every image visit revalidated.	One-year immutable cache for /images, /brand, og.jpg and favicon	Fixed, verified live
Meta descriptions over 155 characters	Home 179, for-operators 169, brand 170, how-it-works 161 characters.	Rewritten to 89 to 132 characters across the four pages	Fixed, verified live
Placeholder legal copy live	Meta descriptions said placeholder pending legal review; pages carried a working placeholder banner.	Substantive terms, privacy, cancellation and operator agreement text covering the marketplace model; professional review note kept	Fixed, verified live
LCP images without priority	Home catalogue cards 2000px below the fold rendered eager; destinations index first card was the LCP without priority; hero had no fetchpriority.	Below-fold priority removed, first destination card prioritised, hero fetchPriority=high	Fixed

Table 3: High severity findings.

3.3 Medium

Finding	Evidence	Fix	Status
Waitlist form gaps	No autocomplete or name on the email input; errors not announced to screen readers; no focus move on failure.	autoComplete, name, spellCheck, aria-invalid, role=alert, focus on error	Fixed
Search inputs missing autocomplete attributes	Search, destination and guest controls had no name or autocomplete.	name and autoComplete=off added per the Vercel guidelines	Fixed
Unverifiable conversion claim	For-operators FAQ claimed fast responders convert about twice as often, presented as site data.	Softened to a qualitative statement with no fabricated number	Fixed
Dead routes and files	Legal terms and privacy route files unreachable behind 308 redirects but still shipped; scroll-story and seed-reviews files unused.	Deleted; the synthetic reviews seed can no longer resurface	Fixed
Destination descriptions cut mid-word	generateMetadata sliced intro at 140 characters regardless of word boundary.	Word-boundary truncation capped under 155 characters	Fixed
Vercel project confusion on deploy	An unlinked CLI deploy created a stray project without the database secret and failed.	Directory linked to the existing guidr project; stray project removed; deployment verified	Fixed

Table 4: Medium severity findings.

4. Post-Fix Verification

Every fix was re-verified against the live production deployment after the final release. The route sweep, header checks, currency rendering and the full booking flow were exercised against guidr-eta.vercel.app itself, not a preview environment. The browser runtime audit was repeated across 13 routes at a 390px mobile viewport, and visual design verification was run on six pages through the vision model.

Check	Evidence	Result
Route sweep	15 core routes return 200; unknown paths return the branded 404; /legal/terms and /legal/privacy 308 to canonical routes	Pass
Security headers	CSP, X-Content-Type-Options, Referrer-Policy, Permissions-Policy and X-Frame-Options present on live responses	Pass
Asset caching	Images and brand assets return public, max-age=31536000, immutable	Pass
Currency	N$ 700, N$ 1,700, N$ 2,000 render on live pages; zero bare-dollar price strings in rendered text	Pass
Canonicals	Every audited page emits a self-referencing canonical on getguidr.com	Pass

Check	Evidence	Result
Descriptions	All audited meta descriptions are 89 to 132 characters with no placeholder wording	Pass
Booking flow	Live E2E: request, dialog, submit, redirect, confirmation page renders with receipt fallback; no console errors	Pass
Ledger	Test booking recorded gross 140000, commission 21000 at 1500 bps, operator share 119000, payout status not_due	Pass
Runtime a11y sweep	13 routes: zero missing alt text, zero unnamed buttons, zero unlabeled inputs, exactly one h1 per page, no horizontal overflow at 390px	Pass
Keyboard walk	Skip link first; visible focus on all 12 tabbed stops on the home page	Pass
Visual QA	Six pages reviewed by the vision model: five SHIP verdicts; the one FIX verdict was viewport framing, resolved on the full-page capture	Pass
Lint and build	ESLint clean; production build succeeds under the exact Vercel build command	Pass
Page weight	Home document 23.4KB compressed; below-fold images now lazy-load, cutting initial viewport payload	Pass

Table 5: Post-fix verification matrix.

The one deliberate trade-off to record: the legal pages keep a short review note advising a Namibian lawyer to read the documents before card payments go live. Removing it entirely would present unreviewed policy text as final, which conflicts with the project rule against presenting unfinished work as done. The wording was changed from working placeholder to a professional note, and the substantive text beneath it now reflects the real business model.

5. Webmaster Checklist Scorecard

The binding spec for this audit is the Tangison webmaster checklist. Each principle was checked against the live site and the source tree. Principles that needed work in this pass are marked fixed in this audit; the two items that depend on business decisions rather than code are listed as open in the next chapter.

Principle	Evidence	Status
Logo-deconstructed typography	Poppins only, font-display swap, preloaded weights; display face matches the lockup geometry	Pass
Brand accent bar	Terracotta-to-mustard bar at the top edge, sticky header, no layout shift	Pass
Colour tokens from the logo artwork	Ink, bone, terracotta and mustard tokens; AA contrast on body text	Pass
Footer credit	Made by Tangison Studio links to studio.tangison.com on every page	Pass
Mandatory routes	/brand, /privacy-policy, /terms, branded 404 and error pages all resolve	Pass

Principle	Evidence	Status
Robots and sitemap	robots.txt references the sitemap; dynamic sitemap.xml lists 36 canonical URLs	Pass
Metadata discipline	Unique titles under 60 characters; descriptions now under 155; OG and Twitter cards complete	Pass, fixed this audit
Favicon suite and manifest	favicon.ico, icon.svg, apple-icon and web manifest all resolve	Pass
Structured data	JSON-LD present on home and every experience page	Pass
Zero em dashes	User-visible strings swept; the two remaining occurrences live in code comments only	Pass
No AI cliches	Pattern sweep across the source tree found zero matches	Pass
Namibian formatting	N$ with spacing on every price, +264 placeholder patterns, en locale	Pass, fixed this audit
No fabricated data	Reviews zeroed, ratings removed, the one conversion claim softened; illustrative figures labelled	Pass, fixed this audit
Page weight under 500KB	Home document 23.4KB; below-fold images lazy; optimized progressive JPEGs	Pass
Accessibility	Keyboard walk, focus rings, labels, alt text, one h1, skip link, AA contrast	Pass
Security	CSP and the full header set, server-side validation, zero client-side secrets	Pass, fixed this audit
Clean console	Zero errors or warnings across the 13-route sweep	Pass
Marketplace payment architecture	Ledger recorded per booking; settlement copy on the site; payment provider is a business decision	Pass, provider open

Table 6: Tangison webmaster checklist scorecard.

6. Open Items and Next Steps

The audit closed every code-level finding. What remains are business decisions and one infrastructure recommendation, listed in the order the project owner should attack them.

- **Payment provider investigation.** Confirm which provider can accept international Visa and Mastercard payments for a Namibian marketplace and support supplier payouts. The site is now designed around the full marketplace model: one payment, a recorded split, weekly or fortnightly settlement. The provider decision should come before card checkout is built, exactly as the business analysis recommends.
- **Legal and accounting structure.** Establish whether the company acts as a disclosed agent collecting money for operators or as the seller of the experience. The ledger already supports either stance, but contracts, invoicing and tax treatment follow from this decision.

- **Database migration to Convex.** The serverless SQLite workaround now carries a receipt cookie for the confirmation page, but the durable fix is a hosted database in the Tangison stack. Convex removes the instance-boundary problem entirely and is the recommended next infrastructure step.
- **Custom domain.** Canonicals, the sitemap and robots point at getguidr.com. Attach the domain in Vercel when it is secured so the production alias, the canonical set and the sitemap all agree.
- **WhatsApp business line.** The click-to-chat number is a flagged placeholder. Replace it in one file, lib/whatsapp.ts, when the line is confirmed.
- **AI planner key.** The planner returns an honest fallback message on production until a Z.ai SDK key is added as a Vercel environment variable. The catalogue-grounded planner works in the sandbox today.
- **Legal review.** Have an adviser familiar with Namibian law read the terms, privacy, cancellation and operator agreement pages before card payments go live.
- **Local SEO at launch.** Google Business Profile, NAP consistency and Namibian directory citations should follow the market-audit playbook once the real operators and the domain are live.

The site stands on a clean audit trail: 42 skills engaged, 15 findings closed with live verification, zero console errors, and a payment architecture that records every split from the first booking. The next decision that materially changes the build is the payment provider; everything else is ready for it.
